

Project Proposal

1. The main goal is to build a website for anime enthusiasts where they can search and rate their favorite animes, see detailed information about them, make their own favorite lists, create their own accounts with their own lists, and leave comments for every user to see.
2. Entertainment comes in many forms, like movies they are made for everyone, some people grew up watching anime, some have just started, but if you enjoy this world of entertainment then this website is for you.
3. I will use the Kitsu API for the get routes to retrieve information about animes, like their names, release year, genre and description. As for the user, the Api has some authentication methods that I could use.
4. A.

B. If the API is down then there won't be any web page to use. If some anime are only in Japanese too, I would have to find a way to translate them into English for the user to see.

C. Users' information, such as passwords, passwords would be hashed with Bcrypt and will be stored in the database as encrypted sequences.

D. A user would be able to store the anime they want into their own list, the user could have multiple lists with multiple animes inside, they could also put comments and rate them from 1 to 10.

E. As soon as they get to the main page they will see a preview of anime, and will have the option to make an account, but also will have the option to look for the anime they want to know from.

F. Once I'm done with the project I will try to implement a followers/following method when it comes to users following each other.
